

Hello Sue,

Thank you for our earlier conversation. I genuinely understand your concerns regarding content management within Postman and the importance of test automation for your team.

Regarding content visibility in Postman:

1. [Roles & Permissions](#): We offer distinct team roles like Admin, Billing, and Developer, with more advanced roles in our Enterprise and Pro plans, ensuring precise control over content.
2. [SSO & SCIM](#): Available in our advanced plans, these features enhance security and user provisioning.
3. [Workspace Permissions](#): Control content visibility and modification with workspace roles, including the option for private workspaces.
4. [Version Control](#): Track changes and maintain consistency throughout API development.
5. [Collaboration Tools](#): Integrate with Github, Gitlab, Slack, etc., for a streamlined workflow.

Regarding test automation:

1. [Execution](#) & [Flows](#): Postman follows a sequence of pre-request scripts, requests, and tests for systematic execution. Our flows allow conditional workflows mimicking real-world API scenarios.
2. [Mock Responses](#): Create dynamic responses based on input, supporting early testing.
3. [CI Integration](#): Seamlessly integrate with CI pipelines for continuous testing.
4. [External Data](#) & [Scheduling](#): Use external data for tests and schedule them for regular validation.
5. [Newman](#) & [Akita](#): Run collections via command-line with Newman and gain deeper API insights with our recent Akita acquisition.

To summarize, Postman provides you with in-depth control over content visibility, editability, and a comprehensive suite for testing automation, aligning well with your needs. Each topic above includes a link to detailed documentation that goes more in-depth. I have also provided a couple of short videos that further discuss these topics as well as access to the Postman Intergalactic events both upcoming and past that provide added training, but if you'd like further insights or a demo, don't hesitate to let me know.
